

Supplemental figure 1. Fluorescein-labelled angiogenin in spinal cord after a single i.p. injection.

The photomicrographs show the expression of fluorescein-labelled human recombinant angiogenin protein in cross sections of spinal cord 2 hrs and 4 hrs after a single i.p. injection. There is no staining in the spinal cord cross sections taken from littermates injected with vehicle (Scale bar = 0.5 mm, n = 3 at each time point).
